Lifeline Relay

Faster, safer medication deliveries for small neighborhood pharmacies.

Alison · Davion · Ebony · Garv · Mandy · Nobody · Xantiago

THE PROBLEM

Arthur is a single parent who struggles to get insulin delivered on time.

Arthur is our persona. Small neighborhood pharmacies don't have the delivery systems that big chains do, and a missed handoff can mean a missed dose.

HOW WE HELP ARTHUR

Lifeline Relay helps small pharmacies send faster, safer deliveries.

AI acts as an extra point of contact during the handoff, so the package reaches Arthur or a neighbor Arthur trusts.

HOW IT WORKS

Four steps from pharmacy to doorstep

The pharmacy creates the order

A small pharmacy sets up the delivery.

The patient names delegates

Trusted neighbors who can accept the package.

The driver delivers

No texting while driving. AI handles the messages.

The handoff is verified

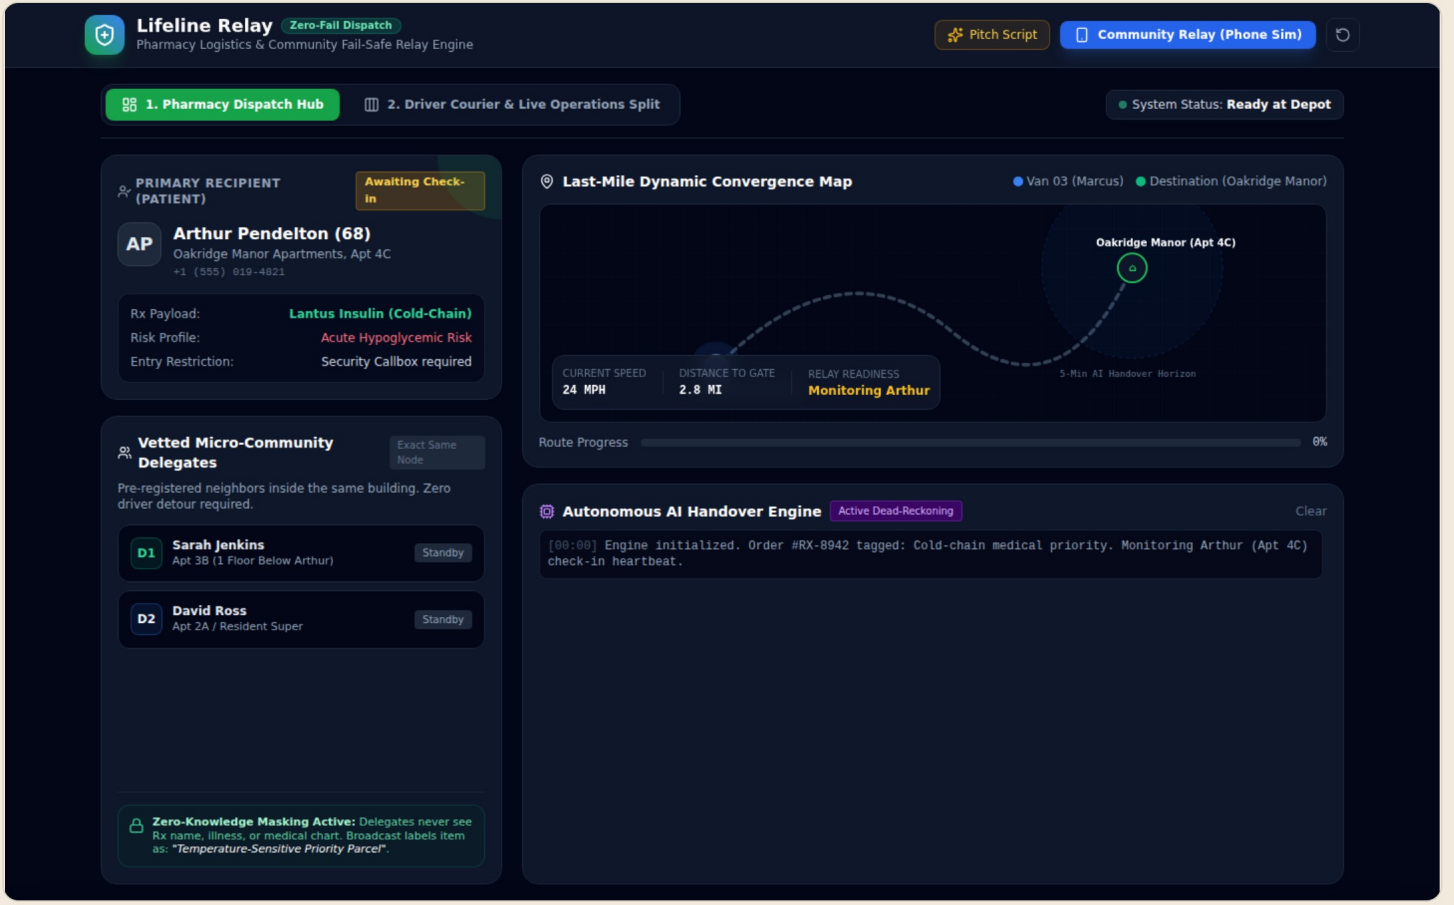

The recipient confirms with a one-time PIN.

SOLUTION DEMO

The pharmacy dispatch view

The prototype lets you switch between the pharmacy, the driver and three phones.

Try it at ebonypaster.com/lifeline-relay

DOES AI DO REAL WORK?

AI is the go-between, so the driver never has to text while driving.

It tells the customer the package is on the way.

It collects replies from the customer and their backups.

It tells the driver who will meet them at the door.

RESPONSIBLE DESIGN

Who could be harmed, and our safeguards

Privacy

Personal information stays between the pharmacy and the customer, and only nearby neighbors can be delegates.

Security

The one-time PIN is for the customer and their delegates only, so the recipient can confirm the handoff.

Accessibility

Phone and text options support people less comfortable with apps and people with hearing or vision needs.

Safeguards

A liability waiver at sign-up means what happens after the handoff isn't on the pharmacy or the driver.

Known gap: people in rural areas with no nearby delegates can't use it yet.

WHAT TESTING FOUND

What we found, and what we fixed

FOUND AND FIXED

- A split view that shows the driver and live operations side by side.
- Combined four screens into two: one for the pharmacy and one for the driver.
- A second backup, so every delivery has two delegates.
- The community phone simulations moved into their own full-screen view.

FOUND, FIXING NEXT

- Remove the driver's access to the PIN code.
- Add a backup plan when the last delegate passes.
- Simplify the first backup's phone to Yes and No buttons.
- Confirm the pickup back to Arthur after "I am ready."
- Stop "Yes, heading down" from sending again and again.

We tested the whole flow before building the marketing and slides. With more time, the next slice would close out the right column.
